Session 2

Session 2, February 16: Grand theories of war and peace

*** (Bueno de Mesquita, 2013)[Chapter 5]

- (Levy, n.d.)
- (Lake, 2011)
- (Lake et al., 2021)
- (Milner et al., 2023)
- (Snyder, 2004)

1 Bueno de Mesquita, 2013 Chapter 5

- War is generally inefficient compared to reaching a negotiated settlement.
- The risks of war may be exacerbated by uncertainty, making credible commitments, or winner-takes-all situation.
- Some important neorealist hypotheses about international peace and stability do not flow logically from that theory's core assumptions. Other important neorealist hypotheses are falsified by the empirical record.
- The link between power transition theory's assumptions and hypotheses is more clear-cut than is true in the case of neorealism.
- Some core power transition hypotheses follow from the theory's logic and are supported by evidence; others either do not follow logically or are not borne out by evidence.
- The power transition theory outperforms neorealism when it comes to offering a structural explanation for war, but its weaknesses point to a need to reconsider its approach to domestic politics.

Consider that estimates of war-related deaths per year in the past 100 years vary approximately from 1 to 2 million.

1.1 War and Uncertainty

The ex ante problems that seem to lead to war can be reduced to three main factors: (1) uncertainty, (2) commitment problems, and (3) indivisibility of issues (Fearon 1995; Slantchev 2003).

1 Absence of **credible commitments** between the sides.

1.1 The inability to **commit to negotiating** patiently rather than seizing the first-strike advantage exacerbates the risk of war (Powell 1999; Slantchev 2003)

1.2 The idea is that the Israelis give up some land in exchange for a guarantee of peace. An alternative formulation reverses the sequence of concessions—the Palestinian Authority disarms its factions that engage in violence against Israel in return for land concessions. Either approach is likely to fail because each induces a fundamental commitment problem.

Land for peace suffers from a time inconsistency problem.

2 Dispute is about an **indivisible objective** → No settlement can produce a compromise in this case of indivisibility, and so there is a severe risk of war. If control over all the land currently held by Israel is truly its irreducible objective, then the land is viewed as indivisible by Hamas.

3 This **uncertainty about the true probability of victory** or defeat might arise out of private (secret) information about the morale of their fighting forces, about knowledge of outside help, about the quality of their war plans, or a host of other possible factors.

1.2 Realist Theory

Neorealist theorists believe that the distribution of power in the international system is a major factor in determining whether international affairs are stable or unstable. Stability refers to circumstances in which the sovereignty of key states is preserved (Gulick 1955). Instability refers to changes in the composition of the international system, especially changes involving the disappearance or emergence of “key” states following large wars. Key states are those whose assistance might be necessary to counteract a threat from a rival coalition of states.

In addressing war and instability, neorealist theories start with the following four assumptions:

1. International politics is anarchic. $\Rightarrow$ there is no supranational authority that can enforce agreements between states.
2. States, as rational unitary entities, are the central actors in international politics. $\Rightarrow$ domestic politics does not influence international politics.
3. States seek to maximize their security above all else and consider other factors only after security is assured. $\Rightarrow$ states are not willing to trade away their security for other benefits. Other possible goals, such as wealth, are pursued only after security has been assured (Waltz 1979, 126).
4. States seek to increase their power as long as doing so does not place their security at risk. $\Rightarrow$ states accept being weaker than they might otherwise be if the pursuit of greater power would place their security at risk.

Most important neorealist conclusions

1. Bipolar systems are more stable than multipolar systems.
2. States engage in balancing behavior so that power becomes more or less equally divided among states over time.
3. States mimic, or echo, one another’s behavior.

2 How Well Does Neorealism Do in Explaining War and Instability? Bipolar vs. Multipolar Systems

Bipolar system

- Dominated by **two major powers**.
- Alliances and commitments are clearer.
- Neorealists argue that it creates **less uncertainty** and therefore **more stability**.

Bipolarity is thought to alleviate two of the conditions we have discussed that are thought to increase the risk of war: uncertainty and commitment problems.

Multipolar system

- Contains **more than two major powers**.
- Alliances and third-party reactions are harder to predict.
- Traditionally associated with **greater uncertainty** and instability.

2.0.1 Historical Examples and Justification for Neorealism

World War I

- Multipolar Europe had several major powers.
- Alliances and commitments were uncertain.
- Britain's and Italy's behavior was not fully predictable.
- This uncertainty supposedly contributed to instability.

Cold War

- Two clear blocs:
 - **US/NATO**
 - **USSR/Warsaw Pact**
- Commitments were much clearer.
- Used as evidence that bipolar systems involve less uncertainty.

2.0.2 Problem with the Uncertainty Argument

The fact that multipolarity creates more uncertainty does **not automatically mean** that it creates instability.

Uncertainty may:

- make states more **cautious**;

-
- make some states more **risk-acceptant**;
 - have different effects depending on decision makers.

Deutsch and Singer even argue that:

multipolarity may be more stable precisely because it produces uncertainty.

Therefore : Uncertainty $\nrightarrow$ Instability

2.0.3 Problem for Neorealist Assumptions

The claim that bipolarity increases stability is **not logically derived from neorealism's basic assumptions**.

If leaders react differently to uncertainty:

- this conflicts with the **unitary rational actor assumption**;
- structural conditions would no longer produce similar state behavior;
- polarity would not have a predictable effect on stability.

2.0.4 Bipolar Balance of Power

Implication: Strict neorealist logic suggests that bipolar stability requires **near-perfect equality of power**.

In a multipolar system, stability depends on **blocking coalitions**.

A coalition controlling half the system's resources can prevent another coalition from becoming dominant.

Perhaps the most common claim among neorealist theorists is that war occurs only when both sides believe that their chance of winning is greater than 50 percent. This is a partial statement of what has come to be known as the balance-of-power theory. It invokes the idea that war is the product of mutual optimism by rival states, meaning that they overestimate their chances of victory

If the neorealist hypothesis were correct, we should observe no wars initiated by the weaker side. The evidence fails to support the hypothesis.

2.0.5 Essential vs. Inessential States

Essential State A state is essential if it is needed to form at least one:

- **blocking coalition**
- **winning coalition**

Other states have an incentive to protect it.

Inessential state A state is inessential if coalitions can succeed without it.

Such a state becomes:

- expendable;
- vulnerable to elimination.

2.0.6 Example of a Stable Multipolar System

Even weak state E is essential to some blocking coalitions.

Therefore:

- other states have incentives to protect E;
- all states remain strategically relevant;
- the system can be **stable**.

2.0.7 Example of an Unstable Multipolar System

Coalitions can win without E.

Therefore:

- E is **inessential**;
- E can be eliminated without threatening the security of the others;
- the system is **unstable**.

2.0.8 Main Implication for Multipolarity

Multipolar systems can be stable under **many different distributions of power**.

Exact equality is not always required.

By contrast, bipolar systems may require a much more precise balance.

Result

Neorealist assumptions may actually allow **more stable power distributions in multipolar systems than in bipolar systems**.

2.0.9 Historical Record of Essential and Inessential States

Inessential states are states that are unable to turn even one losing alliance into a winning or blocking coalition.

1. Essential states never become inessential.
2. Essential states are never eliminated from the international system.
3. Inessential states never become essential states.

-
4. Inessential states are always eliminated from the international system.

Each of these propositions is historically false.

2.0.10 Bipolarity and Stability: War

A possible objection is that war is uncertain.

Even if one state is stronger, it may avoid attacking because victory is not guaranteed.

Let:

$$p = \text{probability of victory}$$

A attacks when:

$$p > U_{\text{status quo}}$$

assuming:

$$U_{\text{winning}} = 1, \quad U_{\text{losing}} = 0$$

War depends not only on power, but also on:

- expectations;
- risk;
- satisfaction with the status quo.

Why This Contradicts Neorealism:

This model assumes states can make a: $\Rightarrow$ **trade-off between security and power**

But according to Kenneth Waltz: $\Rightarrow$ **security is the highest end.**

States seek power mainly as a **means to security**, not as an end in itself.

Allowing states to risk survival for possible gains in power therefore conflicts with core neorealist assumptions.

2.0.11 Overall Conclusion

The traditional claim: *Bipolarity* $\rightarrow$ *Stability* has several problems:

- **uncertainty does not necessarily cause instability;**
- leaders may react differently to uncertainty;
- strict neorealist logic can make bipolar systems stable only under very narrow power distributions;
- multipolar systems can remain stable through **blocking coalitions**;
- introducing probabilistic risk-taking creates assumptions that contradict neorealism itself.

Central conclusion

The hypothesis that bipolar systems are more stable than multipolar systems does not logically follow from neorealism's own assumptions.

2.1 Bipolarity and Stability

1. First, variation in the response to uncertainty violates the unitary rational actor assumption, which contends that important choices in international politics are driven by structural factors, not by considerations internal to the state.
2. Second, if different decision makers respond to uncertainty in different ways, then there is no reason to expect any empirical relationship between bipolarity and stability at all.
3. Third, if leaders differ in how they respond to uncertainty, then the third hypothesis (that states mimic one another) does not hold up.
4. Starting from the neorealist assumptions, we can show that it is logically true that more distributions of power are stable in a multipolar world than in a bipolar world.

2.2 History and Neorealist Empirical Claims

1. The international system was multipolar in structure from 1648 until the defeat of Germany in 1945. Thus, between 1648 and 1945 there were many major powers with no one or two predominating. $\Rightarrow$ The bipolar system began in 1945 and lasted until about 1989.
2. Using Jack Levy's (1983) classification of great powers since 1492, we can determine whether the longevity of the bipolar system was comparatively long or short. $\Rightarrow$
3. Another way to evaluate the stability of the international system is to examine the frequency of wars among the most influential states in the world
4. The UN Security Council (UNSC), then, by institutionalizing a multipolar decision-making structure, has provided a counterweight to bipolarity. This too may be an explanation for the long peace.
5. The average interval between general wars is thirty-four years; the longest interval is ninety-nine years, much longer than the so-called long peace. It appears, then, that the bipolar, long peace cannot be considered unusually long after all and that bipolarity is not a superior treatment for the disease of major power war than is multipolarity.

3 The Power Transition

Building on the work of Edward Carr (1939, 1945) and Organski (1958) constructed what was perhaps the first challenge to realism that was neither idealistic nor normative.

- The international system is not anarchic.
- There is only one dominant state at any given time.
- Rather than wishing to maximize security or power, nations are interested in maximizing their **control over the rules and customs that govern international interactions** so that they can define the status quo according to their interests.

Bretton Woods Agreement $\Rightarrow$ These agreements still maintain a rule-based and normative influence on the trading practices of their members.

Dissatisfaction $\Rightarrow$ it is the more powerful dissatisfied states that represent the biggest threat to international peace and stability.

FIGURE 5.5

The Power Transition Power Triangle

Power transition theory divides the world into two coalitions: (1) satisfied states and (2) dissatisfied states. The stronger a state is, the more likely that it is satisfied with the organization of the international system and the status quo that reflects that system's rules. Weaker states are more likely to be dissatisfied.

Source: Organski (1958).

Figura 1

3.1 Dissatisfaction, the Status Quo, and War

Conflict arises when a dissatisfied state grows strong enough to challenge the authority of the hegemon. Because such a challenge concerns the very way in which international affairs are conducted, the ensuing conflict is fierce and costly.

This time period during which the challenger roughly comes to equal and then surpass the dominant state in power is known as the power transition. It is the time when the threat of a major war is hypothesized to be at its peak. **Contrary to the balance-of-power perspective**, power transition and hegemonic stability theorists believe that major wars are most likely to occur when the power of the opposed states is about equal.

According to these theorists, a balance of power promotes war. They maintain that system-transforming wars—that is, wars that lead to a new power hierarchy and to new rules and norms—will occur only when the power of a challenger and the dominant state are about equal and the power of the challenger is increasing faster than that of the dominant state. These claims have been extended and shown to have **empirical strength** at the regional as well as the global level, so that regional hegemons apparently face the same pressures and the same sources of war as their global counterparts.

Threatening balance of power emerges as a result of differing rates of internal growth between a dominant state and a challenger state. These theories still give little attention to domestic politics per se, but they do recognize that internal factors shape rates of growth.

Power transition theory leads to the hypothesis that system-transforming, high-cost wars are especially likely when a dissatisfied challenger state achieves approximate power parity with the dominant, status quo-defending state.

Kim and Morrow have shown that the distribution of power at which the rivals will fight depends on their willingness to take the risks of waiting. The longer the challenger waits to attack, the higher is its probability of victory. This is true because the challenger's power is growing faster than the dominant state's power. Thus, the longer the challenger puts off a war, the greater will be the odds in its favor. However, the longer it waits, the longer it must endure the rules of international intercourse with which it is dissatisfied.

Kim and Morrow have shown that the interval during which the challenger is willing to fight expands as the expected costs of the war increase, as the challenger's dissatisfaction with the status quo increases, as the challenger's relative growth rate declines, and as the challenger becomes more risk acceptant.

How long the challenger and the dominant states will wait before fighting depends on their respective responses to risk, their relative rates of growth, the expected costs of the war, and their respective degrees of satisfaction with the status quo.

Differences in growth rates turn out not to be crucial empirically.

Power transitions per se cannot explain especially costly wars.

FIGURE 5.6

Power Transition Theory and the Likelihood of War

Figura 2

4 Levy, n.d.

This makes it hard to argue that human nature and related factors are causes of war. The point is that these factors are constants and cannot explain the variations in war and peace over time and space (Waltz 1959, Cashman 1993).

Why does war occur at some times rather than other times, between some states rather than other states, under some political leaders rather than others, in some historical and cultural contexts rather than others, and so on? This differs from still a third question: How do we explain the origins of a particular war? Most international relations scholars (and particularly those in North America) focus primarily on the second question, explaining variations in war and peace. They leave the question of why war occurs at all to philosophers and biologists and leave the question of why a particular war occurs to historians.

Although **anarchy** may provide one persuasive answer to the question of the permissive causes of war, it is generally treated as a structural constant and consequently it cannot account for variations in war and peace.

4.1 The Levels-of-Analysis Framework

Waltz (1959) classified the causes of war in terms of their origins in the individual, the nation-state, and the international system $\Rightarrow$ levels-of-analysis framework as an organizing device for the study of war.

In this sense the systemic level of analysis refers to explanations of patterns and outcomes in the international system; the dyadic level refers to explanations of the strategic interactions between two states; the national level refers to explanations of state foreign policy behavior; the organizational level refers to explanations of the behavior of organizations; and the individual level refers to explanations of the preferences, beliefs, or choices of individuals.

We cannot assume that correlations or causal connections at one level of analysis are necessarily valid at another level. It is conceivable, for example, that concentrations of power may promote peace at the dyadic level but war at the system level.

4.2 Systemic-Level Theories

The realist tradition has dominated the study of war since Thucydides and includes Machiavellians, Hobbesians, classical balance of power theorists, Waltzian neorealists, and hegemonic transition theorists. Although different realist theories often generate conflicting predictions, they share a core of common assumptions: the key actors in world politics are sovereign states that act rationally to advance their security, power, and wealth in a conflictual international system that lacks a legitimate governmental authority to regulate conflicts or enforce agreements.

- they use Prisoner's Dilemma and stag-hunt models
- The core proposition of realist theory is that the distribution of power, throughout the system or within a dyad, is the primary factor shaping international outcomes.

We should treat realism as a paradigm rather than as a theory, and focus instead on specific theories that generate more determinant, testable propositions.

4.2.1 Hegemonic Theory or Power Transition Theory

Hegemonic theory is a structural theory that incorporates power transition theory and hegemonic stability theory and that **downplays the importance of anarchy**.

Hegemons commonly arise and use their strength to create a set of political and economic structures and norms of behavior that enhance the stability of the system while advancing their own security. Differential rates of growth, the costs of imperial overextension, and the development of vested domestic interests lead to the rise and fall of hegemons, and the probability of a major war is greatest at the point when the declining leader is being overtaken by the rising challenger.

Power transition theorists disagree somewhat on the precise identity of hegemonic wars and the particular causal dynamics from which they arise.

4.2.2 Balance of Power Theory

Balance of power theory is more concerned with explaining national strategies, the formation of blocking coalitions, the avoidance of hegemony, and the stability of the system than the origins of wars, which are underdetermined.

There is a major debate, however, between classical realists, who argue that stability is further supported by the presence of a multipolar distribution of power and a “flexible” alliance system (Morgenthau 1967, Gulick 1955), and neorealists, who argue that bipolarity is more stable than multipolarity (Waltz 1979, Mearsheimer 1990).

Balance of power theory and power transition theory appear to be diametrically opposed; the former argues that hegemony never occurs and that concentrations of power are destabilizing, and the latter argues the opposite.

4.2.3 Realism and Liberalism

The relationship between economic interdependence and war is an old question that has attracted new attention in the past few years.

Liberal economic theory of war: Montesquieu [1777 (1748)] stated that “peace is the natural effect of trade,” and liberal economic theorists since Smith [1937 (1776)] and Ricardo [1777 (1817)] have argued that capitalist economic systems and the free exchange of goods in an international market economy are the best guarantors of peace.

Realist: they often argue that the effect of trade on war is small relative to that of military and diplomatic considerations. They also question the liberal assumption that trade is always more efficient than military coercion in expanding markets and investment opportunities and in promoting state wealth.

Whether the incentives for the gains from trade dominate the incentives for coercion or protection based on economic asymmetries, and whether the latter escalate to trade wars and militarized conflicts, are empirical questions that analysts have only recently begun to analyze systematically.

Historical and empirical evidence of trade between enemies

Although liberals and realists disagree on the effects of trade on war, **they appear to agree that trade and other forms of economic interchange between societies will cease or be drastically reduced once states are at war with each other**. Contrary to both liberal and realist expectations, however, **there are numerous historical cases of trade between enemies** during wartime, and a preliminary quantitative study suggests that war frequently

does little to depress the volume of trade between adversaries (Barbieri & Levy 1997).

Need to incorporate domestic variables into their hypotheses

States often hesitate to terminate trade with the enemy for fear that they will lose that trade to a third party, who may be a greater economic or military rival.

These omissions have led all but the most committed neorealists to conclude that **systemic-level theories are theoretically incomplete and empirically inadequate**, in that **they leave too much of the variation in the outbreak and expansion of war unexplained**.

4.3 Social-Level Theories

Although interest in Marxist-Leninist theories has waned, there has been a tremendous growth of research on the relationships between regime type, particularly democratic regimes, and war (analyzed by Ray in this volume). Scholars have also devoted attention to the "diversionary" use of force for domestic political purposes, to the impact of ethnonationalism on international conflict, and to other domestic sources of international conflict.

"rally around the flag" effect (Mueller 1973).

This is the age-old "scapegoat hypothesis" or "diversionary theory of war" (Levy 1989a).

As Bodin argued, "the best way of preserving a state, and guaranteeing it against sedition, rebellion, and civil war is to...find an enemy against whom [the subjects] can make common cause" (quoted in Levy 1989a, p. 259).

research on the scapegoat hypothesis

The absence of significant findings regarding the relationship between internal and external conflict contrasts sharply with evidence of external scapegoating from historical and journalistic accounts and from a growing body of case-study evidence.

Most of these studies have focused on democratic regimes, partly because of the ease of measuring elite support levels but also because of the assumption that the greater political accountability of leaders in democratic states makes them more likely than authoritarian leaders to engage in external scapegoating.

These models help to explain "gambling for resurrection" through risky foreign policies by poor leaders who expect to be removed by their constituents (Downs & Rocke 1995).

This raises the question of how external actors perceive and respond to diversionary actions.

Marxist-Leninist models of imperialism, like models of scapegoating, implicitly assume that external expansion and the use of force serve the interests of the ruling class or elite but not those of society as a whole.

If the costs of aggressive foreign policies are too high—and we have enough examples of "imperial overstretch" to suggest that they sometimes are—it is not clear how elites maintain their power. As Snyder (1991) argued, groups concentrated enough to benefit from overexpansion are too narrow to control state policy, while those broad enough to control policy are too diffuse to reap benefits from overexpansionist policies.

For Snyder, this rationalist model of logrolling is not sufficient to explain overexpansion or the stability of the ruling coalition.

4.4 Individual-Level Theories

decision-making is characterized by "bounded rationality" **Assumptions:**

-
- (a) that external and internal structures and social forces are not translated directly into foreign policy choices;
 - (b) that key decision-makers vary in their definitions of state interests, assessments of threats to those interests, and/or beliefs as to the optimum strategies to achieve those interests; and
 - (c) that differences in the content of actors' belief systems, in the psychological processes through which they acquire information and make judgments and decisions, and in their personalities and emotional states are important intervening variables in explaining observed variation in state behaviors with respect to issues of war and peace.

Prospect Theory one of the most recent attempts to apply a social-psychological model to international relations (Kahneman & Tversky (1979)).

Prospect theory assumes that people evaluate outcomes in terms of deviations from a reference point or aspiration level rather than in terms of net-asset levels.

This asymmetry of behavior with respect to gains and losses means that the way people frame their reference point in any given choice problem is critical.

4.5 General Trends

- shift away from the systemic level: dissatisfaction with the failure of structural systemic models to explain enough of the variance in war and peace. This shift has led to rising interest in both dyadic-level behavior and societal-level explanatory variables.
- Whatever the relationship between concentrations of military and economic capabilities at the systemic level, there is substantial evidence that at the dyadic level an equality of capabilities is significantly more likely to lead to war.
- In the past decade most international relations theorists have moved beyond their earlier preoccupation with explanations at a single level of analysis and debates about which level provides the most powerful explanations. They now give much more attention to interaction effects among variables at different levels in the processes leading to war

5 One World Rival Theories

Snyder (2004)

Figure 3

Realism instills a pragmatic appreciation of the role of power but also warns that states will suffer if they overreach. Liberalism highlights the cooperative potential of mature democracies, especially when working together through effective institutions, but it also notes democracies' tendency to crusade against tyrannies and the propensity of emerging democracies to collapse into violent ethnic turmoil.

Idealism stresses that a consensus on values must underpin any stable political order, yet it also recognizes that forging such a consensus often requires an ideological struggle with the potential for conflict.

It is harder for the normally state-centric realists to explain why the world's only superpower announced a war against al Qaeda, a nonstate terrorist organization. How can realist theory account for the importance of powerful and violent individuals in a world of states? Realists point out that the

Post-9/11 developments seem to undercut one of realism's core concepts: the balance of power.

When Germany unified in the late 19th century and became Europe's leading military and industrial power, Russia and France (and later, Britain) soon aligned to counter its power. Yet no combination of states or other powers can challenge the United States militarily, and no balancing coalition is imminent.

5.1 The Divided House of Liberalism

For its part, the Bush administration highlights democracy promotion while largely turning its back on the international institutions that most liberal theorists champion.

The belief that democracies never fight wars against each other is the closest thing we have to an iron law in social science.

Shortly before September 11, political scientist G. John Ikenberry studied attempts to establish international order by the victors of hegemonic struggles in 1815, 1919, 1945, and 1989. He argued that even the most powerful victor needed to gain the willing cooperation of the vanquished and other weak states by offering a mutually attractive bargain, codified in an international constitutional order.

The Leading Brands

Theories:	Realism	Liberalism	Idealism (Constructivism)
Core Beliefs	Self-interested states compete for power and security	Spread of democracy, global economic ties, and international organizations will strengthen peace	International politics is shaped by persuasive ideas, collective values, culture, and social identities
Key Actors in International Relations	States, which behave similarly regardless of their type of government	States, international institutions, and commercial interests	Promoters of new ideas, transnational activist networks, and nongovernmental organizations
Main Instruments	Military power and state diplomacy	International institutions and global commerce	Ideas and values
Theory's Intellectual Blind Spots	Doesn't account for progress and change in international relations or understanding that legitimacy can be a source of military power	Fails to understand that democratic regimes survive only if they safeguard military power and security; some liberals forget that transitions to democracy are sometimes violent	Does not explain which power structures and social conditions allow for changes in values
What the Theory Explains About the Post-9/11 World	Why the United States responded aggressively to terrorist attacks; the inability of international institutions to restrain military superiority	Why spreading democracy has become such an integral part of current U.S. international security strategy	The increasing role of polemics about values; the importance of transnational political networks (whether terrorists or human rights advocates)
What the Theory Fails to Explain About the Post-9/11 World	The failure of smaller powers to militarily balance the United States; the importance of non-state actors such as al Qaeda; the intense U.S. focus on democratization	Why the United States has failed to work with other democracies through international organizations	Why human rights abuses continue, despite intense activism for humanitarian norms and efforts for international justice

Figura 4

5.2 Idealism

Idealism: the belief that foreign policy is and should be guided by ethical and legal standards.

Constructivism is a new version of idealism: holds that social reality is created through debate about values, often echoes the themes that human rights and international justice activists sound.

Perhaps most important, Europe's increasingly legalistic approach to international relations, reflected in the process of forming the European Union out of a collection of sovereign states, provides fertile soil for idealist and constructivist conceptions of international politics.

Whereas realists dwell on the balance of power and liberals on the power of international trade and democracy, constructivists believe that debates about ideas are the fundamental building blocks of international life. Individuals and groups become powerful if they can convince others to adopt their ideas.

Realists failed to predict the end of the Cold War, for example. Even after it happened, they tended to assume that the new system would become multipolar.

Likewise, the liberal theory of democratic peace is stronger on what happens after states become democratic than in predicting the timing of democratic transitions, let alone prescribing how to make transitions happen peacefully.

Constructivists are good at describing changes in norms and ideas, but they are weak on the material and institutional circumstances necessary to support the emergence of consensus about new values and ideas.

With such uncertain guidance from the theoretical realm, it is no wonder that policymakers, activists, and public commentators fall prey to simplistic or wishful thinking about how to effect change.

6 Why "isms" Are Evil David Lake

Lake, 2011

6.1 Central Argument and Purpose

Lake's essay is a critique of how international studies is organized intellectually and professionally. His central claim is not that theoretical diversity is undesirable, but that scholars have turned theoretical traditions and epistemological preferences into academic "sects." Instead of using theories as limited tools for understanding specific problems, researchers often treat broad traditions such as realism, liberalism, constructivism, Marxism, neoliberal institutionalism, feminism, or the English School as competing intellectual religions. Each group tends to defend its own assumptions, produce research that confirms those assumptions, and debate rival traditions at the level of first principles. In Lake's view, this sectarian organization generates less understanding rather than more. It also distracts scholars from their fundamental social responsibility: improving knowledge of world politics and, where possible, identifying ways to promote more humane outcomes.

The problem is especially serious because the discipline does not possess a single, universal and empirically powerful theory of international politics. World politics is too complex, and existing knowledge is too incomplete, for one general framework to explain everything. Lake therefore urges intellectual humility. Scholars should accept that most theories are partial and contingent, specify the conditions under which they apply, and concentrate on mid-level explanations of concrete phenomena. He favors "analytic eclecticism": researchers should be willing to draw on different assumptions and theories when different problems require different tools. At the epistemological level, he makes a parallel argument. The divide between nomological and narrative forms of explanation is real and enduring, but neither approach is universally superior. Both can produce valid knowledge, and the relevant question is which approach is most illuminating for a particular research problem.

6.2 Theory: How Research Traditions Become Academic Sects

Each research tradition contains a set of core assumptions concerning the relevant actors in world politics, their interests, the processes through which they make decisions, and the nature of political interaction.

International politics is an exceptionally complicated social system, so it is unsurprising that different approaches illuminate different parts of it. The discipline's weakness lies not in pluralism itself but in the professional practices that transform pluralism into sectarianism.

6.3 The first pathology: reifying research traditions

The first pathology is the reification of research traditions. Scholars routinely organize literature reviews, courses, graduate seminars, handbooks, and disciplinary histories around familiar "isms." This has practical advantages because it provides a convenient map of a large literature, but it also creates artificial boundaries. Complex scholarship is reduced to a few recognizable schools,

subtle differences within traditions disappear, and authors are classified according to labels they may not accept themselves. In the process, qualifications and subtleties are often lost. Scholars may see their own work as eclectic and nuanced while categorizing opponents as "realists," "constructivists," or "liberals." As a result, intellectual identities are partly imposed by others. The discipline collectively produces the very categories that then appear to be natural and independent objects.

6.4 The second pathology: reification of canonical works and rewarding extremism

Younger scholars learn that professional recognition may come from taking a distinctive sectarian position. New "isms" and specialized sections of professional become vehicles for status and intellectual entrepreneurship.

6.5 The third pathology: confusing traditions with theories

The third pathology is the tendency to mistake a research tradition for a complete theory.

Several distinct theories can coexist inside a single tradition—for example, offensive realism, defensive realism, and neoclassical realism. They share some core premises but differ in auxiliary assumptions.

Because traditions are often underspecified, they cannot be meaningfully "tested" as wholes. Yet scholars frequently stage empirical contests between traditions as if each generated clear predictions, producing debates in which each side can interpret evidence as confirmation.

6.6 The fourth pathology: selective empirical focus

The fourth pathology is empirical selectivity. Researchers tend to study the **topics, periods, and cases in which their preferred tradition performs well**.

This pattern can emerge naturally because scholars test theories where they initially expect them to work, while journals and publishers also favor positive findings.

The cumulative consequence is self-confirmation. Each tradition studies its strongest domain, finds supportive evidence, and then treats that evidence as proof of general explanatory power.

6.7 The fifth pathology: the search for intellectual hegemony

The fifth pathology is the aspiration of each research tradition to become the dominant scientific paradigm. Professional incentives reinforce this competition. If a tradition becomes dominant, its leading scholars gain status, influence, and control over disciplinary agendas. Because every group fears losing ground to its rivals, competition for hegemony resembles an arms race: even scholars who would prefer cooperation feel pressure to defend and expand their approach. The collective result is worse for everyone. Rather than acknowledging the limited scope of existing theories, research communities expend enormous energy debating assumptions. Comparable theories are not applied to the same phenomena.

6.8 Lake's Alternative: Problems, Partial Theories, and a Common Lexicon

Lake's preferred alternative is to reorganize scholarship and academic life around substantive problems rather than around intellectual sects. The guiding question would then be "What do we

know about this problem?" rather than "What are the core assumptions of this school?" Such an organization would encourage scholars to compare explanations on the basis of their contribution to understanding a phenomenon instead of their loyalty to a tradition.

A central part of this alternative is what Lake calls an "embrace of partiality." His metaphor is the familiar image of several people touching different parts of an elephant: each theory may capture one part accurately, while no single theory describes the entire animal.

6.9 Interests, interactions, and institutions

Analytic eclecticism creates a possible communication problem: if scholars abandon fixed traditions, the field could become a "tower of Babel" in which theories are too different to compare. Lake therefore proposes a common lexicon built around three broad concepts: interests, interactions, and institutions. Any complete theory of politics must specify who the relevant actors are, what they want, how they interact, and the institutional environment in which interaction occurs.

This lexicon is deliberately neutral among traditions so that it can still be translated into the same basic questions about actors, interests, interactions, and institutions.

6.10 Epistemology: The Enduring Divide

Lake then turns from theory to epistemology. He identifies a deep divide between nomological and narrative forms of explanation. He does not believe that one epistemology will or should defeat the other. The discipline should therefore accept epistemological diversity.

6.11 The nomological approach

The nomological approach seeks generalizable explanations based on covering laws or theoretically specified relationships. It typically uses the hypothetical-deductive method: researchers derive falsifiable propositions of the form "if X, then Y" and test them using designs that approximate controlled experiments. True experiments offer the strongest internal validity, followed by quasi-experiments and then correlational studies such as regression analysis. External validity therefore rests on clearly specified scope and boundary conditions.

6.12 The narrative approach

The narrative protocol begins with a descriptive order that links events. It then constructs an interpretation of the historical facts.

Abduction.

The objective is to produce a **convincing and plausible account** of events.

Narrative explanations are often richer and more holistic than nomological models.

Their weakness is that the criteria for judging causal adequacy are more subjective.

6.13 Epistemological Sectarianism and Lake's Recommendations

The same pathologies that affect theory also affect epistemology.

Epistemological gatekeepers can influence hiring, resource allocation, publication, and access to professional networks, encouraging scholars to cluster with others who share the same standards

of explanation. Lake sees no objective basis for declaring one epistemology universally superior. Scholars may simply find one form of explanation more intuitively satisfying than another, much as some people find beauty in mathematics and others in poetry.

6.14 Conclusion

Lake's alternative is more problem-centered.

The ultimate measure of success should be whether scholarship improves our understanding of world politics and contributes, where possible, to social progress.

7 Challenges to the Liberal Order: Summary

David A. Lake, Lisa L. Martin, and Thomas Risse (2021)

7.1 Introduction and Central Argument

The Liberal International Order (LIO) is under pressure from several directions at once. The authors emphasize that the postwar order has survived serious crises before, so its collapse should not be assumed.

The LIO has structured relations among the capitalist, democratic, and industrialized states since the late 1940s and has had wider global effects. It is associated with unprecedented cooperation among North America, Western Europe, and Japan, the emergence of a pluralistic security community, expansion of trade and capital mobility, high economic growth, the diffusion of democracy, and the development of an international human-rights regime.

7.2 Order

An order consists of patterned or structured relations. The LIO is clearly rule-governed and sustained by coordinated action by both state and nonstate actors.

7.3 International and the Westphalian Order

The "international" component of the LIO has to be understood in relation to the Westphalian order. In the authors' usage, Westphalia is not literally a system created in 1648 but a later order centered on sovereign nation-states, sovereign equality, recognition by other states, and noninterference in domestic affairs. The LIO and the Westphalian order partly overlap and have coevolved since 1945. They share principles such as sovereign equality, peaceful settlement of disputes, self-determination, and nonintervention. At the same time, the LIO goes beyond Westphalia through principles such as human rights and forms of legitimate collective intrusion into domestic affairs.

FIGURE 1. *The LIO and the Westphalian order*

Figura 5

7.4 Liberal: Political Liberalism

At its philosophical core, liberalism rests on universal human equality, freedom, and individual and collective self-determination. Political liberalism therefore implies the rule of law, representative government, political participation, and protection of individual rights.

Institutions such as the International Criminal Court and doctrines such as the Responsibility to Protect illustrate how the LIO can authorize constraints on domestic sovereignty in the name of universal rights.

7.5 Economic Liberalism and Embedded Liberalism

A classical version favors market capitalism, free trade, international capital mobility, and equal treatment of foreign investment.

A second, historically important version is embedded liberalism. The postwar architects of the Bretton Woods system combined trade liberalization with domestic welfare states.

The distinction is important because economic liberalism does not automatically contradict Westphalian sovereignty.

The LIO broadly liberalized goods, services, and capital but never generally established free movement of labor outside the EU.

7.6 Liberal Internationalism

The institutional dimension of the LIO is based on principled multilateralism. Multilateralism means more than coordination among several states: it means coordination according to generalized rules that apply across cases rather than ad hoc bargaining based solely on particular interests. The GATT, WTO and UN Charter exemplify this logic. Liberal internationalism also includes peaceful dispute resolution, the ambition to provide global public goods, security communities such as NATO, and multilateral arms-control and nonproliferation regimes.

Tensions with Westphalia:

1. Authority is delegated supranational bodies
2. Majority voting
3. Dispute-settlement mechanisms
4. International courts.

7.7 Universalism and Selective Participation

The LIO contains a paradox. Because liberalism begins from universal equality, the order is in principle open to all states. Yet states can join important parts of the LIO without being liberal democracies.

The LIO is therefore best understood as an evolving order whose components vary in reach rather than as a single uniform system imposed everywhere by the United States.

7.8 Challenges from Within the Liberal Core

The most striking contemporary threats come not only from geopolitical rivals but also from the internal workings of liberalism itself. The authors identify several mechanisms through which the LIO generates opposition within its own core members.

1. Economic liberalism creates winners and losers. Trade openness, technological change, global production chains, and the financial crisis of 2008–2010 have produced geographically concentrated losses and contributed to rising inequality.
2. Political openness can be used against liberalism. Freedom of expression and the open architecture of the internet allow misinformation, foreign influence, and strategies of "truth subversion" to circulate widely.
3. Free-trade policies and supranational governance were sometimes insulated from popular pressure in order to prevent protectionism and secure long-term cooperation. Over time, however, this technocratic insulation excluded some constituencies and created resentment. International institutions appeared less responsive to citizens.
4. liberal universalism collides with national identity. Who belongs to the national community? Migration is a problem

7.9 Nationalist Populism and Political Realignment

These pressures converge in movements combining nationalism, populism, and authoritarianism. Nationalism prioritizes the interests and identity of a particular state; populism pits a supposedly

homogeneous "people" against elites and pluralist institutions; authoritarianism rejects liberal constraints such as independent courts, a free press, and fair electoral competition.

7.10 External Challengers

- Climate change
- Distributional conflicts due to Climate change
- China: Its extraordinary economic growth was enabled by participation in the open international economy, yet China remains authoritarian and strongly defends sovereignty and noninterference.

7.11 The Erosion of Multilateral Institutions

Internal and external challenges converge most directly in attacks on multilateralism. Multilateral institutions have experienced crises before, including the collapse of the Bretton Woods monetary system and the US decision to invade Iraq without broad UN support. What appears different in the contemporary period is the breadth of skepticism and the willingness of major states to weaken institutions without a clear systemic necessity.

1. WTO crisis: Even before the recent crisis it struggled to negotiate large new trade agreements. The United States combined protectionist tariffs with a strategy of blocking appointments to the WTO Appellate Body, impairing enforcement.
2. Refugee crisis: The refugee regime illustrates a broader erosion of multilateral commitments. The principle of nonrefoulement and the 1951 Refugee Convention created legal obligations toward asylum seekers, yet receiving states have increasingly adopted restrictive or deterrent policies.

7.12 Sources of Resilience

1. the order has produced substantial benefits: reduced conflict among core members, economic growth, lower global poverty, and extensive international cooperation.
2. LIO has generated vested interests: Firms have built global investments and supply chains that depend on open trade and predictable international rules. The same interdependence that creates vulnerability can also reinforce support for openness.
3. the LIO institutions can outlast the circumstances that produced them and act as shock absorbers during crises.
4. **Legitimacy:** After decades of operation, many rules of multilateral cooperation have acquired a sense of normality and rightfulness. Practices that once required active justification can become taken for granted as normal components of international life.

Accumulated normative capital

Political baseline

7.13 Four Analytic Blind Spots in IR Scholarship

1. **Exclusion**, stigma, and the threat of losing membership help enforce order. Exclusion is not merely a defect at the margins of the LIO.
2. **Orders Are Not Neutral:** distributional consequences and the fact that rules are written by particular actors for particular purposes. Cooperation can be Pareto-improving while still distributing gains unequally.
3. **Institutions Depend on Social Foundations:** Institutions survive because social groups invest political resources in creating and defending them. Institutional insulation may sometimes be necessary to protect long-term cooperation from short-term pressures.
4. **Domestic Politics Can Challenge the Order Itself:** IR scholarship paid little attention to the possibility that parties, protest movements, territorial cleavages, and mass political realignments inside core states could attack the international order itself.

7.14 USA and the Future of LIO

Question about American leadership.

- The LIO could survive because existing institutions and old and new stakeholders defend it.
- more traditional Westphalian order centered on sovereignty and noninterference.
- It could be transformed into a hybrid order that preserves economic openness and principled multilateralism while altering commitments to democracy, human rights, and international legal authority.

Part II

Session 3

Session 3, February 23: The strategic perspective

*** Bueno de Mesquita (2013)[Introduction]

- Bueno de Mesquita (2013)[Chapter 1]
- Bueno de Mesquita (2013)[Chapter 2]

8 Bueno de Mesquita, 2013 Introduction

8.0.1 Basic Principles

1. The actions that leaders take to influence events in the international arena are motivated by their personal welfare and, especially, by a desire to stay in office. Leaders' concerns for the national interest are subordinate to personal interests. If the two coincide, then so much the better; if they do not, leaders do what they believe is best for themselves even when doing so harms most citizens and, in that sense, the national interest.
2. International relations cannot be separated from domestic politics. Every foreign policy action is undertaken in the shadow of the domestic political consequences the action is expected to produce. Therefore, if a foreign policy is expected to achieve beneficial consequences for a nation in the long term but in the short term will result in the ouster of the leader, then that policy will not be pursued.
3. Relations between nations and between leaders are driven by strategic considerations. As such, foreign policy decisions are designed to influence international affairs and the leader's well-being. To be effective in this, foreign policies must be chosen with an eye toward the reaction they will create among friends and adversaries. The reaction expected from a policy choice is compared with the reaction anticipated from other policy options. Leaders pick the policy they believe will produce the best outcome for them, knowing that, at the same time, domestic and foreign rivals are choosing policies to enhance their own well-being.

8.0.2 Liberalism

Liberal theories emerged as a counterweight to the neorealist perspective. Unlike realist approaches, liberalism draws attention to the frequent and often long-standing occurrences of international cooperation. Indeed, a desire to explain such cooperation is its first point of departure from neorealism. Furthermore, for liberal theories, structural hierarchy, which implies the presence of an actor that can authoritatively enforce agreements between states (rather than anarchy, a system in which states must be able to help themselves because they cannot count on anyone else), is the central organizing principle of international politics. The presence of a hegemonic state (an overwhelmingly dominant power) helps enforce norms of conduct and maintain regimes. Norms are generally observed patterns of conduct.

8.0.3 Constructivism

Constructivism, is a theoretical perspective that focuses on explaining how certain types objectives come into being or change. Constructivism began primarily as an attempt to theorize about the formation of identity, that is how we see ourselves.

Constructivism does not view decision makers as primarily strategic. Rather, leaders are thought initially to adopt a course of action for strategic reasons—to obtain legitimacy—but then to become caught up in socially accepted norms of conduct.

Unfortunately, much of the empirical research to evaluate this theory's conjectures is poorly designed to do so.

Thus, their research designs tend to unintentionally contain an antifalsification bias.

Recent efforts to evaluate constructivism in a manner more consistent with the scientific method tend not to find much support for constructivist hypotheses.

Constructivism leads to the expectation that preferences will converge among the members as they adopt shared norms and are subjected to pressures and persuasion. Nevertheless, König and Luetgert report that, "The results refute the claims of constructivists predicting that positions converge and increase the capacity to act due to common norms, rhetoric action or persuasion" (2005, 6).

8.0.4 A BRIEF HISTORY OF INTERNATIONAL RELATIONS THINKING

Wilson's idealism, the dominant approach to international affairs before World War II, painted a rosy picture of states cooperating with one another in promoting peace, democracy, and prosperity.

Today, realist ideas, in their turn, face significant challenges. These challenges reflect: (1) the insufficiency of realist theories to anticipate or explain the peaceful ending of the Cold War and the accompanying implosion of the Soviet Union and the unraveling of its Eastern European empire (Gaddis 1992); (2) the discovery that several of the most important realist propositions suffer from logical inconsistencies (Milner 1998; Powell 1994, 1999); (3) the discovery that key logically consistent realist propositions turn out to be falsified by the record of history; and (4) the growing evidence that the causes of and solutions to international conflict can be better understood, as urged by Russell and Wright, by looking within states (Bueno de Mesquita et al. 2003; Fearon 1994; Smith 1996).

The Treaty of Westphalia emphasized territoriality over personal loyalties as the foundation for international relations. It was primarily in this emphasis on the institutional importance of borders that the treaty broke with the feudal past.

The idea of territoriality has other significant implications. An important one concerns the central role that states play in international affairs. Because each state's territorial borders define a domain within which its rulers have sovereign authority over the use of force (Krasner 1999; Spruyt 1994), international law has come to view all states as legally equivalent entities. This, in turn, is a factor behind the realist concept of the state as a unitary actor. It is why international relations focus on states and not multinational corporations, ethnic groups, or other ways of dividing up the international pie.

His outlook embodies the idea that there should be no separation of powers, that the state's interests and the leader's interests are one and the same. In such a world, treating states as unitary actors (the king) makes perfectly good sense.

Central among these differences are the extent to which leaders are accountable to a small inner

circle of supporters or to a broad constituency and the extent to which leaders insulate themselves from accountability to their core constituency.

Iraq and the Realist View At least in the years 2003-2007, American leaders who were concerned about advancing Iraq's reconstruction seem to have believed, in solid realist fashion, that American power was, by itself, enough to ensure that Iraq would follow the policy path prescribed by the United States.

Iraq's leaders would pay more attention to managing their relations with contending Iraqi factions such as those led by Muqtada al-Sadr (the anti-American cleric) and Grand Ayatollah Ali Sistani (the more moderate religious leader) than to implementing the policies promoted by the United States. Realist theory leaves little room for such a focus on domestic threats to political survival.

many foreign policy developments, from the collapse of the Soviet Union and the end of the cold war to the morass in Iraq, are at least as much the product of domestic politics as of international competition. To fix such problems, we have to think about the motivations and incentives of leaders and of rival politicians and about how we can alter their behavior based on responding to their motivations and incentives rather than worrying so much about the balance of power between states.

8.0.5 Solving International Relation Puzzles

Each of these subjects, and many others, are explored in the chapters that follow. These issues are generally discussed in terms of four broad categories of problems: coordination, distribution, monitoring, and sanctioning. Coordination entails finding ways for states or leaders to act together in pursuit of common objectives. Distribution concerns the allocation of scarce goods among citizens, leaders, and states. Monitoring involves detecting situations in which one or another leader or state has cheated on an agreement. Sanctioning concerns punishing cases of cheating. These four generic issues are at the core of cooperation.

8.0.6 Power, Preferences, and Perceptions: The Three Pillars of International Relations

International relations as a subject is primarily about the choices and actions that political leaders take in the name of their nation to influence how their state relates to other states.

In August 1991, for instance, hundreds of thousands of Russian citizens intent on deflating a coup in progress gathered in Moscow's Red Square. Those who gathered there believed that they could help shape the course of events. They acted on this perception by mobilizing the power they had in numbers to display their preference.

Power: Ultimately, power is about mobilizing resources to alter the behavior of others. Power is an instrument for promoting and achieving goals.

Preferences: Foreign policy goals and the ways nations interact with one another are reflections of the preferences, or desires, of key foreign policy leaders and those constituents whose support they require to stay in office. The preferences of constituents are important because if a leader's preferences are sufficiently inconsistent with the wants and desires of his or her core constituents, then the leader runs the risk of being overthrown. Such a risk emanates from two sources. First, opponents capable of jeopardizing a leader's authority may arise from within the state, as is true when there is a revolution, coup, or electoral defeat.

In addition, opponents may arise from outside the state.

Perceptions: Leaders may misjudge the amount of resources or degree of power they can

mobilize on behalf of their nation or miscalculate the level of political support that will follow from their pursuit of articulated preferences.

9 Bueno de Mesquita, 2013 Chapter 1, Evaluating Arguments about International Politics

Theories are important in helping us sort out which facts are essential in understanding international affairs.

Every theory should be susceptible to being falsified by evidence and should be evaluated in terms of its logical consistency.

In keeping with the first principle of wing walking, a theory should not be abandoned before there is substantial evidence in favor of an alternative explanation.

You might think that a review of the history of lots of past events and circumstances is the road to understanding.

Explanations, however, are not strings of facts. Explanation requires theory.

9.1 Constructing Theories

constructing theories $\Rightarrow$ assumptions

1. Assumptions are the principal means by which theorists simplify reality.
2. Assumptions limit the domain of circumstances that the theory is capable of addressing
3. A good starting place to judge a theory's value is to evaluate whether its assumptions contradict one another—that is, whether there are internal inconsistencies.

Judging Theories: Perhaps the most influential international relations theorist of the post-World War II decades, Hans Morgenthau.

Truth and Falsity in Assumptions: So while true and false refer to internal consistency,, useful or trivial refers to its empirical value.

The value of one or another assumption is a practical matter; if an assumption adds to the theory's predictive ability more than it takes away, then it is useful.

The First Principle of Wing Walking If you are out on the wing of an airplane in flight, don't let go of what you are holding on to unless you have something better to hold on to.

The Case Study Method and Testing Theories When cases are selected because they are consistent with a particular claim, they are not a fair test of the accuracy of the claim.

Selection Bias: selection of cases was driven by ex post knowledge of the value on the dependent variable.

The principle of random case selection has been well established among statisticians for over a century.

Remember that theories are about relationships among variables, not about constants.

Example: Commonly, the researcher selects a case with a known cooperative outcome and then looks for the existence of an international regime or organization that can be said to have fostered the cooperative outcome. Perhaps the author is correct in the assessment of the role of the regime, but this does not at all tell us whether similar regimes also operated in settings that did not lead to cooperation between states.

A Standard for Comparing Theories This means we choose one theory over another if it clearly outperforms the competing theory (Popper 1963; Laudan 1977; Lakatos 1978).

The Scientific Method

1. Scientific analysis requires logical consistency
2. Competing arguments can be evaluated through experiments that control for confounding, alternative explanations.
3. Randomness ensures that the tests control for the possible effects of other factors.
4. Tests must also be replicable;

When a Theory Is Wrong A theory is more or less parsimonious depending on how many facts it explains compared with the number of assumptions it requires to make predictions. In general, the more events or facts a theory can explain with a limited set of assumptions, the greater the potential usefulness of the theory and the greater its parsimony.

Scientific Theories Must Be Falsifiable It is essential that a theory seeking the imprimatur of science be susceptible to possible falsification.

Practical use of Theories

10 Bueno de Mesquita, 2013 Chapter 2, The Strategic Perspective

The strategic perspective $\Rightarrow$ 1- foreign policy is part of normal domestic politics 2- any national leader faces a difficult problem in balancing the interests of constituents and the desires of foreign rivals.

Four basic categories of international problems arise: (1) coordination, (2) distribution, (3) monitoring, and (4) sanctioning. Each of these is molded internally by agency problems.

Rather than speaking of governments in categorical terms such as democracy, monarchy, and autocracy, we use two crucial domestic factors to differentiate them: (1) the size of the selectorate (those with a say in choosing leaders) and (2) the size of the winning coalition (those in the selectorate whose support is essential to keep a leader in office).

Polities that rely on a large winning coalition emphasize producing public goods over private rewards for coalition members. They produce greater prosperity, more efficient governance, and low rates of corruption; their leaders stay in office for a relatively short time.

Polities that rely on a small winning coalition and a large selectorate, such as autocracies with rigged elections, tend to produce high degrees of kleptocracy, poor public policies, and high levels of corruption and rent-seeking; their leaders last in office for a very long time.

States with large-winning-coalition systems are more likely to enjoy not only prosperity but also peace, especially with one another, while states with small-winning-coalition systems tend not only to be poor but also to experience lots of wars with other states, as well as undergoing revolutions, civil wars, and coups d'état.

States with large-winning-coalition systems differ from states with small-winning-coalition regimes in their use of foreign aid, military intervention, warfare, and a host of other critical choices in international affairs.

10.1 International Politics: Domestic Politics with a Twist

There is at least one critical difference between domestic and international politics. In the arena of purely domestic affairs, political leaders need not worry that their actions will prompt a foreign government to jeopardize their hold on power.

In domestic politics leaders select policies (including foreign policies) and actions designed to keep them in office.

In international affairs, leaders must worry that their foreign policies not only may mobilize domestic opposition capable of overthrowing them but also may irritate a foreign rival, sparking attack and possible defeat. That distinction is central to the principles of international politics (Putnam 1988).

10.1.1 Example: The Afghan Taliban's Problem in 2001

Afghanistan's Taliban leaders drew important support from Osama bin Laden and others in Al Qaeda's terrorist network, and Al Qaeda had turned Afghanistan into their home base. For the Taliban to break with them would surely have aroused an active effort by Al Qaeda and its allies to depose the Afghan rulers and replace them with others more likely to cooperate. Yet the United States and its key allies were visibly banding together after September 11, 2001, threatening to overthrow the Taliban government unless it broke with bin Laden. The Taliban chose to gamble that the American threat was less dangerous than the risks associated with

breaking with Al Qaeda.

10.1.2 Example: The Israeli Prime Minister's Problem

Without pro-settler policies, it is difficult for any Israeli prime minister to stay in office.

Given that Israel's proportional representation electoral system encourages small, fringe parties and given that the conservative Likud Party and the more centrist Kadima Party both rely on support from religious parties to muster a majority in the Knesset, we know that these parties cannot hold office if they alienate the pro-settlement religious party voters.

Almost certainly all parties to the dispute want a peaceful settlement more than they want war but they cannot agree on the contents of such a settlement (Fearon 1995).

10.1.3 Who and What to Study in International Affairs

1- Coordination entails finding ways for states or leaders to act together in pursuit of common objectives. Neither the Israelis nor the Palestinians want to collide; they would all like to coordinate on peace.

2- Distribution concerns the allocation of scarce goods among citizens, leaders, and states.

3- Monitoring involves putting into place the means to detect whether one or another leader or state has cheated on an agreement.

4- Sanctioning concerns punishing cases of cheating and is always susceptible to the parties deciding to renegotiate their agreement because punishing the cheater can be costly for the compliant signatory or signatories too.

International treaties provide a common means of addressing these problems and represent an important feature of international efforts at cooperation.

principal agent problem between the leaders who negotiate and the constituents.

We often don't have enough information to sort out whether our leaders are faithfully serving our interest.

Associated with the principal-agent problem, we as citizens may face another generic problem tied to monitoring and sanctioning our leaders (Aggiungo io, selection problems nel scegliere i leaders).

10.1.4 The Strategic Perspective

Lots of evidence has been compiled that shows international law and international organizations tend to be pretty ineffective when the stakes are high and national leaders are disinclined to abide by common norms of action.

10.1.5 Domestic Theories of International Affairs: A First Look

The actions of leaders are incentive compatible with their desire to stay in power and control revenue allocation.

James Fearon (1994), Alastair Smith (1998), and others suggest that democratic leaders are more likely than autocrats to carry out the foreign policy threats they make because of their domestic political **audience costs**.

Schultz (1998, 2001) shows another feature that follows from having a domestic audience and thus audience costs: because of the risk of losing office following an unsuccessful foreign policy adventure, there is a **selection effect**.

→ **audience costs** ⇒ **selection effect**.

Democratic leaders, facing a legitimate and vocal opposition, are less likely to select risky foreign policies than are autocrats.

Democrats are much more likely to win the wars they start than are autocrats, not just because they are generally better at fighting wars but because they cannot afford to lose if they hope to get reelected.

Domestic Theories of International Affairs: Example Schultz's reasoning offers a compelling explanation for the appearance, and disappearance, of a bipartisan American foreign policy.

Typically, American foreign policy is thought of as nonpartisan and as driven by efforts to advance the national interest. Rarely, however, is there much effort to explain why partisanship should not be as important in foreign policy decisions as it is in the routine domestic choices of political leaders.

If the incumbent party and its leaders select a foreign policy that is unpopular or that is believed will be unsuccessful, then they can anticipate that the other party's leaders and candidates will see an opportunity to win votes by opposing the majority party's foreign policy.

10.2 Selectorate Theory

The selectorate theory represents one version of the strategic perspective.

In selectorate theory, leaders build a coalition of supporters among the selectorate. The selectorate (S) consists of those who have at least a nominal say in choosing leaders and are eligible to become members of a winning coalition. The winning coalition (W) is the subset of the selectorate without whose support an incumbent cannot be sustained in office.

Leaders attempt to retain the loyalty of their supporters by giving them more benefits than any domestic political opponent can credibly promise to deliver. Rewards come in two varieties:

(1) private goods:

Private goods are rewards that benefit only those who get them—that is, members of the leader's essential coalition of supporters.

Examples might include privileged access to government contracts, exploitation of a black market, or protection against prosecution.

(2) public goods.

Public goods are government policies and programs that all people benefit from whether they are in the leader's inner circle or not.

Examples of public goods include national defense, free speech and free assembly, public parks, equal protection under the law, and free access to education.

The selectorate theory's five rules of governance are as follows:

1. Depend on as few key people to keep you in power as possible.

-
2. Draw that small group of essential coalition members from as large a pool of people as possible.
 3. Tax people as much as possible, subject to the constraints that they continue to work and pay taxes rather than take siestas, and that they are not made so miserable that they decide it is worthwhile to risk revolting rather than continue to live with the existing political system.
 4. Reward your essential backers just enough so they stick with you rather than shopping around for a new leader who might do more for them.
 5. Don't spend resources on benefiting the general population when those resources are needed to keep the loyalty of the members of your essential coalition.

When domestic institutions constrain a leader to require a broad base of support private rewards are an inefficient way to retain power (de Tocqueville 2000; Lake and Baum 2001; Bueno de Mesquita et al. 2003; Bueno de Mesquita and Smith 2011). Democratic leaders would have to spread these rewards across so many people that each would receive too little for the benefits to influence their loyalty to the incumbent.

When political institutions compel a leader to depend on many supporters so that a bundle of public goods is the reward for retaining the incumbent, **the institutions of governance induce weak loyalty to the incumbent.**

Conversely, when a leader needs backing only from a few people to stay in power, the few are expected to be loyal both because they are well rewarded with private benefits and because they face a high risk of losing those privileges if a challenger topples the incumbent regime.

FIGURE 2.2 Governance Institutions

Governance Dimensions: Nested Selectorate Institutions

Figura 6

Historically, we have spoken of categorical types of regimes, like democracies or autocracies. In practice, no two governments are alike. All political systems have two institutional characteristics that describe how they retain and select their leaders.

When W/S is small, as in a rigged election autocracy, then there is a **strong loyalty norm** that makes it easy for leaders to survive in power and exert great discretion over revenue as explained next.

Examples: Egypt vs HCina and Syria vs Nigeria For example, China and Egypt both had winning coalitions with a size that was close to 0 percent of the adult population, yet Egypt back then had a larger real selectorate than China relative to their adult populations. This means that both regimes, as we will see, were heavily oriented toward private goods but that leaders had more discretion over revenue in Egypt than in China. All else being equal, then, Egypt's then leader Hosni Mubarak had a better chance of remaining in power against an ordinary political challenge than did China's then incumbent president Hu Jintao.

Syria and Nigeria differ markedly. Nigeria has a smaller selectorate than Syria but depends on a much larger winning coalition. This means that the loyalty norm is stronger in Syria than in Nigeria. That makes the preparedness of the winning coalition's members to take extraordinary actions on behalf of the incumbent regime more robust in Syria than in Nigeria.

Examples: Putin Putin needed support from only half the members of parliament to get their legislative program through the Duma and, in a two-party race, each candidate needed only half the voters to support him to be elected, making the maximum minimal winning coalition in Russia 25 percent $[0.5 \text{ (voters per seat)} \times 0.5 \text{ (number of seats)}]$. With more than two parties (and there were seven parties contesting the 2011 Duma election), the actual minimal winning coalition was smaller.

10.3 Public and Private Goods: Who Gets Rewarded as W and S Change?

W = Winning Coalition, it is the subset of the selectorate without whose support an incumbent cannot be sustained in office.

R = Total revenues

p = price of public goods

g = mix of public goods

z = each coalition member's private goods benefits

$$z = (R - p * g) / W$$

The odds of being in a successor coalition are the ratio W/S , which in this case is 100/1,000,000, or 1/10,000.

The expected value of the prospective defector's share of the private goods to be dispensed by the successor regime is only 1000.

$$\frac{\text{total revenues}}{\text{number of winning coalition}} * \text{probability of belonging to the coalition} =$$

$$\frac{R}{W} * \frac{W}{S} = \frac{1,000,000,000}{100} * \frac{100}{1,000,000} = 1000$$

The incumbent can keep the difference between the 10 million per supporter that could be distributed, and the something above 1,000 per supporter that needs to be distributed.

It is easy to see that as long as the incumbent beats that expectation and provides public policies that are not much worse than those proposed by the challenger, the would-be defector can be kept happy and loyal.

10.3.1 Conclusions

1. **the greatest incumbency advantage in using private goods to satisfy constituents belongs to the leaders of political systems that have small winning coalitions and large selectorates.**
2. **Supporters in a large-coalition public-goods-oriented setting receive the benefits of public goods even if their leader is replaced by a challenger, such as after an election. This means that they can support a challenger with little consequence since they are getting few private gains in any event.**

10.3.2 Leader Survival

Autocracy and democracy are fundamentally different in their consequences even though all leaders are assumed to want the same thing (to keep their jobs and have discretion over as many resources as possible). Democratic politics in selectorate theory is a competition in competence to produce public goods; autocratic politics centers on the purchase of the loyalty of key supporters through bribery, corruption, and rent seeking.

10.3.3 Conclusion

The selectorate theory logically implies several basic principles of politics that are applied repeatedly throughout this book. The most important of these principles are as follows:

1. Regimes with large winning coalitions focus on effective policies, including foreign policies. When leaders' policies do poorly, they either switch them or pour more resources into trying to make them succeed.
2. Regimes with small winning coalitions tolerate failed domestic and foreign policies better than do regimes with large coalitions because in small-coalition settings loyalty to a leader depends more on receiving private rewards than public benefits. As a consequence, leaders mostly continue on their policy course even when their policies are failing. They do not change course as quickly as large-coalition leaders, and they do not put extra resources into trying to make the policies, including foreign security and trade policies, succeed under most circumstances.
3. The likelihood that a leader survives in office despite failed policies increases as W/S decreases (so that the polity becomes more autocratic) and decreases as W/S increases (so that the polity becomes more democratic).
4. As W/S increases, leaders must spend more revenue to maintain loyalty among their coalition members and, as a result, these leaders have proportionately fewer revenue sources at their discretionary use than do those who depend on a small coalition drawn from a large selectorate.
5. Corruption and kleptocracy (governing by theft) increase in prominence as W gets smaller, especially when S also gets larger.

-
6. The foreign policies of small-coalition leaders are more heavily driven by the pursuit of opportunities for enrichment through territorial conquest, tribute, and the like rather than the pursuit of policy compliance from foreign rivals.
 7. The foreign policies of large-coalition leaders are more heavily driven by the pursuit of policy compliance by foreign governments than by the pursuit of enrichment.
 8. When leaders can change political arrangements, they prefer to decrease the size of their coalition and increase the size of the selectorate.
 9. When coalition members can change institutions (e.g., through coups), they always prefer to increase the ratio W/S and may, depending on circumstances, prefer to do so by increasing W more quickly than S or decreasing W more slowly than S .
 10. When people who are not in the coalition have the opportunity to change institutions of government (e.g., through revolution or civil war), they always prefer to increase W and to increase W/S .

Part III

Session 4

Session 4, March 2: Bargaining theory of war

*** Lake (2010)

- Fearon (1995)
- Sechser and Fuhrmann (2013)
- Powell (2004)

11 Two Cheers for Bargaining Theory David A. Lake

Despite its prominence, however, bargaining theory is an inadequate explanation of the Iraq War.

1. First, bargaining theory assumes that states are unitary actors. As the Iraq case demonstrates, domestic political actors played an important role in driving the United States and Iraq to war.
2. Second, bargaining theory is now modeled in two-player games. In the Iraq War, this analytic simplification masks important dynamics.
3. Third, bargaining theory assumes that a war is over once a settlement is reached. The postwar peace is an important additional stage of conflict that needs to be integrated into the bargaining framework.
4. These deviations from rationality suggest possible gains from integrating bargaining theory with the sorts of cognitive biases identified by scholars in an earlier literature on misperception.

11.1 The Bargaining Theory of War

on average it can do no better state might prefer a solution at its ideal point

If fighting is costly for at least one state, there must exist a bargaining range that will leave both sides better off than war.

In summary, bargaining theory implies that war is always a failure, an inefficient way to settle disputes.

War occurs, in turn, when:

- (1) commitments are not credible

This is most clear when the distribution of capabilities between the parties is shifting. The state that is growing stronger will have an incentive to demand a more favorable division of the issue in the future.

- (2) states possess private information about their costs of fighting and incentives to misrepresent that information.

Because negotiating is always better than fighting, actors typically have incentives to reveal their private information- signal their type- to their opponent. In some circumstances, however, revealing private information may undermine a state's ability to prevail if war occurs, creating an incentive not to reveal or even to misrepresent that information.

(3) states are uncertain over their probability of victory.

11.2 Bargaining and the Costs of the Iraq War

Iraq's supposed WMD programs were the *casus belli*, they were the precipitant and not the underlying issue, and are better thought of as one source of bargaining failure.

The most plausible interpretation of the issue under dispute is that the United States and Iraq were different visions for the future of the region.

The most fundamental insight of bargaining theory is that, because war is costly, there must exist a negotiated outcome that will leave both sides better off than actually fighting. The first step in assessing the theory, therefore, is to determine whether the war was indeed costly and expected to be so, whether a bargain was possible, and whether there were viable alternatives to war.

11.2.1 The Cost of War

- Monetary expenses for the war
- In addition, the United States has suffered enormous costs to its international reputation by launching a preventive war without the support of the international community.
- estimates of casualties range from 100,000 to 600,000 deaths

11.2.2 Was a Bargaining Possible?

The notion that the Bush administration desired a war because of its hawkish preferences rests on two incorrect suppositions.

1. First, for this explanation to be true, the Bush administration would have had to have been insensitive to or insulated from the costs of war to the United States as a whole.
2. Second, for the explanation to hold, the expected benefits from demonstrating the usability of force would have had to exceed the actual costs of the fighting.

A second possible explanation for the conflict is that the Bush administration, again, wanted war in order to construct a viable democracy in Iraq, demonstrate that such a regime could thrive in the Middle East, and undercut support for Islamic fundamentalism.

Nonetheless, it is not clear why war itself was necessary to bring about a democratic regime. Forcing the internal collapse of Saddam's regime, stimulating a coup, or perhaps even supporting a domestic insurrection might have been more effective at lower cost. Indeed, given the sectarian violence that broke out immediately after the war and the hardening of religious and ethnic groups that followed, a successful democratic transition might have been more feasible in the absence of direct U.S. intervention.

Saddam was no doubt less sensitive to the costs of fighting than the average Iraqi. His effective costs of fighting were less than those for the country as a whole. But given his likely defeat and

high probability of punishment for himself, his family, his clan, and his political support base bargaining seemed a feasible option.

11.2.3 Alternatives to War

1. the United States sought to contain and deter Baghdad through a combination of continued sanctions designed to coerce Iraq's compliance with UN resolutions and explicit threats that any Iraqi use of WMD would provoke devastating retaliation.
2. the United States pursued a policy of forcible inspections. This strategy promised to be an expanded version of the sanctions and inspections regime imposed after 1991.
3. the United States aimed to stimulate regime change from within Iraq. Shiites in the south were encouraged by Washington to rise up against the Baathist regime. In the absence of external support, they were brutally crushed.

11.3 The Problem of Credible Commitment

11.3.1 Incredible Saddam

In Iraq, it was not present WMD programs that truly mattered, but future capabilities and intentions that created the problem of credible commitment.

The core issue, as a result, was not Iraq's present WMD capacity, but how WMD, if produced, would affect the likely bargains between the two countries at some future date.

11.3.2 The Problems of Prior Beliefs and Multiple Audiences

Although bargaining theory highlights the critical commitment problem behind the war, it cannot explain why Iraq was seen as more threatening in 2003 than in 1998 and more threatening than other rogue regimes. The Iraq War calls attention to where prior beliefs come from, how they vary, and perhaps how they may be affected by groupthink within more or less closed circles of decision-makers.

This should direct future scholarly attention to understanding the origins of prior beliefs that, in turn, magnify or mitigate problems of credible commitment.

The puzzle is deepened once one understands that Iraq had already dismantled its WMD programs during the 1990s. The real question is what prevented Iraq from credibly signaling the United States that it did not have the capacity to develop or transfer WMD?

Of these players, Saddam was actually more concerned with his domestic competitors and Iran than with the United States.

1. Saddam had actually used chemical weapons against internal enemies.
2. Subsequently, the regime believed that the perception that it still possessed WMD could deter future internal rebellions, even though such weapons had limited military utility.

The United States never seriously considered that Saddam's unwillingness to open his country to inspection might be directed at his domestic and regional opponents rather than at Washington.

Overall, it was the inability of Iraq to commit to a limited bargain that helped drive the United States to war. Theory is useful in revealing the underlying logic of the bargaining failure in this

case, but the difficulty in sending a sufficiently large signal to the United States rested on the multiactor environment.

11.4 Information Asymmetries in the United States and Iraq

Contrary to expectations, there was relatively little private information in this case. The U.S. war plan was widely discussed in news reports, and there was no doubt about the likely outcome. The USA signaled its plans clearly. With victory all but certain, the United States was unwilling to settle for anything short of Iraq's complete capitulation, most likely entailing the exile of Saddam and his extended family and his replacement by a new regime of the Bush administration's choosing.

Nonetheless, private information mattered in two distinct ways, neither of which is anticipated by present bargaining theory.

Based on the United States' withdrawals from Lebanon in 1984 and Somalia in 1993, and its early termination of the Persian Gulf War in 1991, Saddam believed that the Bush administration was bluffing.

No one risked telling Saddam what he did not want to hear.

On the U.S. side, in turn, the Bush administration likely underestimated its own costs of war. Whether this was strategic or sincere remains difficult to disentangle.

Notably, the outrage of the administration at Army Chief of Staff Gen. Eric Shinseki's realistic estimate of the number of troops eventually necessary for the occupation discouraged other knowledgeable individuals from coming forward with facts that challenged the administration's estimates.

Regardless of the administration's motives, the American public appears to have accepted the administration's position that the costs of war would be low.

Together, Saddam's belief that the United States was bluffing and the Bush administration's position that the costs of war would be low prevented an effective bargain from being realized.

11.5 Postwar Governance Costs

As discussed above, a class of bargaining models explains extended wars as a process of revealing information. These models, however, add little directly to scholars' understanding of conflict dynamics in Iraq. Given its quick and decisive nature, the "war" phase of the conflict did not reveal much new information.

1. First, the Bush administration assumed that inside the heart of every Iraqi was a "small d" democrat yearning to be free. As Cheney stated, "I really do believe that we will be greeted as liberators."
2. Second, the Bush administration failed to anticipate the decrepit state of Iraq's infrastructure, thus rendering moot its early estimates that oil revenues would quickly begin to flow and pay for the occupation. Under international sanctions and threatened by domestic unrest, the regime withdrew from detailed management of the economy in the 1990s, focusing on its immediate survival.
3. Third, the Bush administration failed to plan for the tensions that were released between religious groups once the Sunni-dominated government was defeated.

-
4. Finally, the administration incorrectly expected that Iraqi military and police forces would remain intact to provide political stability after the war.

Alternatively, had the administration understood that securing the peace would be far more expensive than winning the war, it might not have launched the invasion, or it would have been willing to accept a compromise short of removing Saddam from power.

11.6 Domestic Politics and War

It is highly unlikely that domestic interests were determinative in the war. Special interests do not appear sufficient to have caused the Iraq War.

If domestic interests were driving the United States to war, the expected outcome was that Iraq would have offered Washington a better deal.

11.7 Analytic Lessons Learned: Toward a Behavioral Theory of War

1. First, as the Iraq War makes blindingly obvious, the postwar governance costs of imposing one's will on the defeated enemy must be incorporated into the victor's cost of fighting.
2. Second, bargaining theory has been developed as a two-player game, mainly for reasons of technical tractability. Theorists are aware that most conflicts involve more than two parties.
3. Third, although the subject of the most public furor and ire before the war, special interests are in some ways the simplest amendment to bargaining theory suggested here.
4. Finally, the most severe challenge to bargaining theory arises from the cognitive and decision-making biases that were so evident in the Bush administration and in Saddam and his regime.

The informational imperfections appear to have been about, for the United States, its own costs of fighting and, for Iraq, easily knowable elements of the Bush administration's resolve and military strategy.

Prospect theory predicts that decision-makers are risk averse in the domain of gains and risk acceptant in the domain of losses. In addition, prospect theory posits that decision-makers use "prototype heuristics," a form of stereotyping in which salient examples from a larger class are assumed to be overrepresented in the category. This can lead to "attribute substitution," in which favored outcomes are judged to have lower costs and higher benefits than they actually possess.

Framing also mattered. As noted, the United States confronted a loss of future influence in the Persian Gulf. As prospect theory would predict, the administration was willing to run high risks in an effort to disarm Iraq once and for all.

A behavioral theory of war should retain the core insight of bargaining theory that war is fundamentally strategic, with conflict dependent on the interaction of the choices of two or more actors, and a failure of bargaining.

11.8 What or Who Failed? Policy Lessons from the Iraq War

1. From a policy perspective, first, the administration failed to pursue alternatives that might have revealed information about Iraq's weapons capabilities. Although this does not resolve

the issue of future intentions, the window for diplomacy was significantly larger than the administration led Americans and others to believe.

2. Second, the administration grossly underestimated the costs to the United States of fighting the war. Most egregiously, it utterly failed to consider the costs to the United States of governing Iraq after deposing its leadership.
3. Finally, concluding that the probability of victory was high and the costs of war were low, the administration demanded too much of Iraq, including the creation of a new state premised on a liberal ideology of democracy and free markets that conflicted with traditional political institutions and cultures in the region.

11.9 Conclusion

Because Saddam could not credibly commit to a skeptical Bush administration that he would refrain from developing WMD in the future, the United States eventually chose a preventive war to foreclose the possibility that Iraq would compete with it for influence in the region at some later date.

12 James D. Fearon — Rationalist Explanations for War

12.1 Central Puzzle and the Bargaining Framework

Fearon begins from a simple but fundamental puzzle: war is costly and risky, yet wars repeatedly occur. The article asks how war can arise between genuinely rational, unitary states whose leaders understand the costs of fighting. Fearon distinguishes this question from explanations based on irrationality or domestic political pathologies. His goal is narrower and foundational: if rationalist explanations are to work, they must show why rational states sometimes fail to reach a negotiated settlement that both would prefer to the costly gamble of war.

The key move is to treat war as a bargaining problem. Suppose two states dispute an issue that can be divided along a continuous interval. If state A wins a war with probability p and both states pay positive costs of fighting, then war is a costly lottery. A's expected payoff from war is p minus its costs, while B's is $1-p$ minus its costs. Because both sides lose something by fighting, there normally exists a set of peaceful divisions that gives each side more than its expected payoff from war. This set is the bargaining range. In the risk-neutral case, the width of the range is essentially the sum of the two sides' costs of war. Risk aversion makes the peaceful range even larger.

This result shifts the explanatory burden. It is not enough to say that a leader expects the benefits of war to exceed the costs. Even if war has positive expected utility, both sides should still prefer a bargain that reproduces the expected distributional outcome without paying the costs of combat. War is *ex post* inefficient, and this inefficiency normally creates an *ex ante* space for agreement. A coherent rationalist theory of war must therefore explain why states cannot locate or agree on a settlement inside that range.

12.2 Why Standard Rationalist Arguments Are Incomplete

Fearon evaluates several familiar explanations. First, anarchy by itself is insufficient. The absence of a world government may permit the use of force, but it does not explain why states choose an option that destroys resources when mutually preferable bargains are available. The security

dilemma similarly can generate fear, arms races, and competition, but unless one specifies how the absence of enforceable commitments blocks a peaceful bargain, the argument does not solve the bargaining puzzle.

Second, the standard preventive-war argument is incomplete. A declining state may fear that a rising state will become stronger and exploit it later. But this immediately raises a bargaining question: why cannot the rising state make concessions today and promise future concessions sufficient to induce the declining state not to attack? The problem is not power shifts in themselves. Preventive war becomes a genuine rationalist explanation only when the changing balance of power creates a commitment problem—when the rising state cannot credibly commit not to use its future strength to revise the agreement.

Third, positive expected utility for war is not enough. Two states can both believe that war is worthwhile relative to the status quo and still possess a bargaining range that would make both better off. Finally, issue indivisibility is logically capable of eliminating the bargaining range, but Fearon treats it as empirically less compelling. Most international disputes are multidimensional, and side payments, issue linkages, partitions, alternation, or lotteries can often create intermediate outcomes. When issues appear indivisible in practice, the deeper cause may be nationalism, domestic political constraints, or some other mechanism rather than a natural indivisibility of the issue itself.

12.3 Private Information and Incentives to Misrepresent

Fearon's first major mechanism combines private information with strategic incentives to misrepresent it. Leaders may possess information about military capabilities, tactics, resolve, or the value they attach to the disputed issue that the opponent does not know. This can create divergent estimates of the likely outcome of war or of the opponent's willingness to fight. Yet simple uncertainty is not sufficient: because war is costly, rational states have incentives to communicate and reveal information that would help them avoid an inefficient conflict.

The problem is that bargaining creates incentives to bluff. A state that appears stronger or more resolved may obtain a better settlement. A weak state may exaggerate its willingness to fight to deter demands; a strong state may conceal capabilities to preserve surprise; leaders may hide domestic or military information that would weaken their bargaining position. Consequently, ordinary diplomatic statements are not automatically credible. A state cannot simply ask its opponent how far it is willing to go and trust the answer.

This logic explains why rational miscalculation can persist. Consider a challenger that is uncertain about the target's costs of fighting. With complete information, the challenger would demand just enough to leave the target indifferent between accepting and fighting, thereby avoiding war. With private information, however, the challenger faces a trade-off: a larger demand yields greater gains if the target acquiesces but a higher risk that the target will resist. Under broad conditions, the challenger's optimal demand therefore entails a positive probability of war. Conflict emerges not because leaders ignore information but because the strategic incentives surrounding private information make perfectly revealing communication impossible.

The same reasoning applies to disputes about relative power. Conflicting expectations can shrink or eliminate the apparent bargaining range, but rational actors must have some basis for holding different beliefs. Private information about capabilities is one source. Yet the critical mechanism is again the difficulty of credibly revealing that information. The article therefore recasts many traditional claims about miscalculation as specific bargaining failures produced by asymmetric information and incentives to dissemble.

12.4 Commitment Problems

Fearon's second major mechanism is the commitment problem. Even when both sides possess complete information and can identify a bargain preferable to war, an agreement may not be sustainable if one side cannot credibly promise to honor it later. Anarchy matters here in a specific rather than generic way: without an external authority capable of enforcing agreements, a state may have no way to bind its own future behavior.

The most important example is preventive war under shifting power. A rising state may be willing to grant concessions while weak, but once it becomes stronger it will have an incentive to demand more. The declining state anticipates this future revision and may prefer to fight now, while its military position is still favorable. The current war is inefficient, but the peaceful bargain is dynamically inconsistent. The rising state cannot credibly commit not to exploit its future power, and the declining state cannot be compensated enough by promises that will later become unenforceable.

Fearon also identifies other commitment problems. A state may be unable to promise not to exploit a strategically valuable territory after acquiring it, or adversaries may be unable to make credible agreements concerning disarmament when weapons are needed to enforce the bargain itself. Preemptive pressures can likewise emerge when mobilization or first-strike advantages make promises not to attack incredible. Across these cases, the central issue is the same: a bargain exists in static terms, but incentives to renege prevent it from being implemented.

12.5 Conclusion and Significance

Fearon's conclusion has two central claims. First, because war is costly and risky, mutually preferable negotiated settlements should exist under broad conditions. The common image of rational states simply reaching a deadlock in which no peaceful agreement is available is therefore misleading. Second, two causal mechanisms provide the strongest rationalist explanations for why bargaining nonetheless fails: private information combined with incentives to misrepresent, and commitment problems that make otherwise attractive bargains unenforceable. Issue indivisibility is logically possible but less persuasive as a general explanation.

The article does not claim that irrationality, domestic politics, or psychological biases are unimportant. Rather, it establishes a benchmark for the rational-unitary-actor case. Once the implications of rationality are specified clearly, scholars can better identify when a war requires additional explanations. The broader contribution is to reorient the study of war away from lists of motives for fighting and toward a sharper bargaining question: if both sides would save resources by settling, what concrete strategic obstacle prevents them from doing so? That question became the foundation of the modern bargaining model of war.

13 Robert Powell — The Inefficient Use of Power: Costly Conflict with Complete Information

13.1 The Inefficiency Puzzle

Powell studies a broad political puzzle: actors sometimes use costly forms of power even though they could, in principle, reach an agreement that leaves everyone better off. Examples include war, civil war, coups, revolutions, policy insulation, and other forms of coercion. The use of power consumes resources, so the total benefits available before conflict are larger than those remaining afterward. This implies that costly conflict is Pareto inefficient. The central question is therefore why bargainers sometimes fail to reach a Pareto-superior settlement before power is used.

Much of the bargaining literature explains inefficiency through asymmetric information. Powell instead concentrates on commitment problems that can produce bargaining breakdown even under complete information. The actors may know each other's preferences, capabilities, and options perfectly, yet still be unable to sustain an efficient agreement because future incentives make promises incredible. His goal is to identify a common mechanism behind several apparently different models and to express that mechanism as a general inefficiency condition for stochastic games.

13.2 A Common Commitment Problem Across Political Settings

The common structure is dynamic. Actors bargain over a flow of benefits rather than a single one-time pie. They cannot fully commit today to how future benefits will be divided, and the amount each actor can guarantee itself through the use of power changes over time. When the strategic environment shifts rapidly, an agreement that is attractive today may cease to be incentive-compatible tomorrow. This makes efficient bargaining dynamically inconsistent.

Powell illustrates the mechanism through several existing models. In Acemoglu and Robinson's work on political transitions, rich and poor factions compete for control. A temporarily powerful faction may be bought off only if transfers continue for several periods. Yet when political or economic conditions change, the faction promising future concessions gains an incentive to renege. Anticipating this, the temporarily strong faction may prefer a costly coup or revolution now.

Fearon's model of secessionist civil war has a similar logic. When the government is temporarily weak, rebels have a window of opportunity. The government would like to offer enough regional control to induce peace, but the rebels' value of fighting may exceed what can be transferred in a single period. A sufficient concession therefore requires a multi-period promise. If the government is likely to become strong again, however, it will later prefer to retract the concessions. Knowing this, the rebels fight while the opportunity exists, even though both sides would prefer an enforceable peaceful arrangement.

De Figueiredo's model of policy insulation provides a domestic analogue. A politically weak party that happens to be in office may deliberately make its policy difficult and costly to reverse. Such insulation is inefficient, but the party expects to lose power and cannot trust its opponent to preserve the policy later. The ability of the future majority to overturn today's policy makes reciprocal restraint difficult to sustain.

Powell's own preventive-war model shows the same pattern in international politics. A declining state bargains with a rising state whose probability of military victory increases over time. The rising state would prefer to promise the declining state a favorable territorial settlement in order to avoid war. Yet as the rising state grows stronger, its payoff from fighting increases and it

becomes less willing to respect the earlier bargain. If the change in power is sufficiently large and rapid, the declining state rationally prefers to fight before its position worsens.

13.3 The General Mechanism: Shifts in Bargaining Power

Across these cases, a temporarily weak actor needs to buy off an adversary that currently possesses a valuable option to use power. Because the use of power is costly, there are enough total resources to make peaceful accommodation desirable. The difficulty is that resource constraints often prevent the needed compensation from being paid immediately. The transfer must instead be spread across a concession phase lasting several periods.

During this concession phase, the strategic environment may change. The actor that is weak today may become strong tomorrow. Once stronger, it can secure a better outcome by abandoning the promised transfers. Since the future beneficiary anticipates this, the promise is not credible today. Thus the problem is not ignorance about future power: all changes can be common knowledge. Nor is it simply impatience. The breakdown comes from the interaction of limited current transfers, inability to commit to future transfers, and a sufficiently rapid shift in the distribution of bargaining power.

This is why complete information does not guarantee efficiency. In a static bargain, knowing all payoffs would normally allow the actors to divide the surplus. In a changing environment, however, the allocation that would induce restraint today may require behavior tomorrow that will no longer be optimal for the actor making the promise. The use of power becomes a way to lock in an outcome before the strategic balance changes.

13.4 The Inefficiency Condition

Powell formalizes the argument in a two-player stochastic game. A stochastic game differs from a standard repeated game because the strategic environment can move among different states. Each actor has a minmax payoff in every continuation game: the minimum payoff it can guarantee itself regardless of what the opponent does. Powell treats these minmax payoffs as a measure of relative bargaining power because they capture what an actor can lock in through its own actions.

The core inefficiency condition states, in substance, that an efficient path cannot be sustained when at some point an actor can guarantee itself more by deviating than it can receive while continuing to cooperate. One useful interpretation is a 'lock-in' condition: if one actor's current guaranteed payoff plus the discounted amount the other actor can guarantee itself in the next period exceeds the total flow of benefits available, both claims cannot simultaneously be satisfied. There is then no efficient equilibrium at that point.

A second and especially intuitive interpretation compares the expected shift in an actor's minmax payoff with the bargaining surplus. If the expected increase in one side's guaranteed future payoff is larger than the surplus generated by avoiding costly conflict, no feasible sequence of transfers can keep both sides satisfied. In less formal terms, large and rapid changes in relative power can make all equilibria inefficient. The speed and magnitude of the change matter because they determine how quickly today's credible concessions become tomorrow's unattractive promises.

A third interpretation emphasizes the limit on credible transfers. An actor can compensate its opponent partly in the current period and partly through promised future transfers. Yet future promises are bounded by what the promisor will voluntarily honor once the strategic environment changes. If the opponent's current minmax payoff exceeds the sum of what can be transferred now and what can credibly be promised later, the use of power cannot be bought off.

13.5 Stable Environments and the Broader Contribution

Powell contrasts stochastic games with infinitely repeated games. In an ordinary repeated game the strategic environment does not change: the same stage game recurs indefinitely. Because continuation values remain stable, there are no large jumps in minmax payoffs to undermine future cooperation. If actors are sufficiently patient, standard folk-theorem results therefore allow efficient equilibria. This comparison underscores that the source of inefficiency in Powell's argument is not repetition itself but rapid movement in the distribution of bargaining power.

The broader contribution is to unify diverse literatures. Coups, revolutions, civil wars, preventive wars, and policy insulation can all be understood as manifestations of the same commitment problem. A temporarily favorable opportunity to use power becomes attractive when an opponent cannot credibly promise the concessions required to make restraint worthwhile over time. The article therefore generalizes the bargaining logic of commitment problems beyond international war.

Powell also identifies an agenda for future research. His general model treats shifts in power largely as exogenous: governments become strong or weak, parties gain or lose office, and military balances change. Explaining the microfoundations of those shifts—why they occur, how quickly they occur, and when political actors can influence them—is essential for determining where the inefficiency mechanism should be most important empirically. The main theoretical lesson nevertheless remains clear: costly conflict does not require hidden information. Even with complete information, rapid changes in relative power combined with limited commitment can make efficient bargaining impossible.

14 Todd S. Sechser & Matthew Fuhrmann — Crisis Bargaining and Nuclear Blackmail

14.1 Research Question and Main Argument

Sechser and Fuhrmann ask whether nuclear weapons give states an advantage when they try to compel other states to make concessions. The distinction between deterrence and compellence is crucial. Deterrence seeks to prevent an opponent from changing the status quo; compellence seeks to make an opponent take an action, reverse a policy, or relinquish something it already possesses. Nuclear weapons are widely believed to strengthen deterrence, but their usefulness for compellence is much less clear.

A common view holds that nuclear weapons cast a 'looming shadow' over crisis bargaining. Because nuclear states can inflict extraordinary destruction, targets should be more willing to comply with their demands. The supposed advantage may be greatest when only the challenger has nuclear weapons, because the target cannot retaliate in kind. Some scholars further claim that the effect does not require an explicit nuclear threat: simple possession of a nuclear arsenal may increase the challenger's leverage.

The authors reject this logic. Their central claim is that nuclear weapons are uniquely poor instruments of compellence. Successful compellent threats are especially plausible when a challenger can credibly threaten to seize the disputed object by force and when carrying out the threatened punishment would impose relatively low costs on the challenger. Nuclear weapons satisfy neither condition. They may protect possessions or deter threats to survival, but they do not normally help a state force an opponent to surrender an existing possession or alter behavior.

14.2 Why Nuclear Weapons Are Weak Compellent Tools

The first limitation is that nuclear weapons are not useful tools of conquest. Many compellent disputes concern territory, cities, or other objects that the challenger wants to acquire. Conventional military forces can threaten to take and hold such objects, which may induce a target to concede rather than fight a losing war. Nuclear weapons, by contrast, are designed for destruction, not occupation. Using them against the disputed territory may destroy the very object the challenger wants and cause massive damage to populations the challenger may wish to control.

The second limitation concerns punishment. A nuclear state could threaten to destroy something else the target values—for example, a city—unless the target gives in. Yet actually carrying out such a threat for nondefensive purposes would be extraordinarily costly. Nuclear use could trigger international condemnation, sanctions, diplomatic isolation, counterbalancing, or further nuclear proliferation. These political and economic costs make nuclear punishment difficult to threaten credibly in ordinary compellent disputes.

This helps explain why deterrence and compellence should have different nuclear dynamics. When a state's survival is directly threatened, the enormous costs of nuclear use may still be acceptable, making a deterrent threat credible. Compellent demands usually involve objectives that are valuable but not vital: territory the challenger does not currently possess, policy changes, reparations, or similar concessions. Because the challenger has already survived without the desired object, a target has reason to doubt that it would really accept the enormous costs of nuclear escalation to obtain it. The authors therefore predict that nuclear challengers should not make systematically more successful compellent threats than nonnuclear challengers.

14.3 Problems in Earlier Research

The article argues that previous studies often cannot answer the comparative question properly. Many qualitative studies select only famous nuclear crises, especially Cold War episodes involving the United States. Such designs lack a nonnuclear comparison group, so they cannot establish whether nuclear states are more successful than comparable nonnuclear states. Selecting famous or prolonged crises may also overrepresent failed coercive threats, because successful threats often end crises quickly and quietly.

Existing quantitative datasets create a different problem. Datasets such as International Crisis Behavior and Militarized Interstate Disputes contain many episodes in which no compellent threat was made at all. They also often classify battlefield victories as crisis successes. This confuses brute-force achievement with coercive success. For the authors, a successful threat is one that obtains compliance without the challenger having to carry out major military force. The 1991 Gulf War illustrates the distinction: the coalition won militarily, but the prewar ultimatum compelling Iraq to leave Kuwait failed because Iraq refused and war followed.

14.4 Research Design and Measurement

To address these problems, Sechser and Fuhrmann use the Militarized Compellent Threats (MCT) dataset. It contains more than 200 interstate compellent threats from 1918 to 2001, including 242 challenger-target dyads. Every case includes both a demand to change the status quo and an explicit or implicit threat of military force. The dataset includes nuclear and nonnuclear challengers, famous and obscure crises, and cases in which nuclear weapons were or were not discussed.

The dependent variable, compellence success, equals one only when the target voluntarily complies with all of the challenger's demands and the challenger does not need to use military force to obtain the outcome. Roughly 30 percent of the threats in the dataset meet this standard. The main explanatory variables measure whether the challenger possesses nuclear weapons, whether the target is nuclear armed, and the interaction between the two. The authors also test alternative measures such as arsenal size, nuclear superiority, the nuclear capability ratio, and the numerical difference in arsenal size.

The statistical models control for important alternative explanations. Conventional capability matters because a state with superior nonnuclear military power may be more coercively effective regardless of its nuclear arsenal. The stakes variable distinguishes demands over territory or leadership from lower-stakes disputes. The authors also measure costly demonstrations of resolve and the recent history of militarized disputes within the dyad. Probit models estimate the probability that a compellent threat succeeds, with clustered standard errors to account for repeated observations of some country pairs.

14.5 Empirical Findings

The results provide no support for the claim that nuclear weapons improve compellent bargaining performance. Nuclear challengers are not statistically more likely to succeed than nonnuclear challengers. The conditional claim fares no better: nuclear states do not gain a reliable advantage even when the target lacks nuclear weapons. In the authors' estimates, threats by nuclear challengers against nonnuclear targets are, if anything, somewhat less likely to succeed, although the key point is that the nuclear effect is not reliably positive.

The conclusion remains unchanged when nuclear power is measured in different ways. Larger arsenals, nuclear superiority over the target, nuclear capability ratios, and absolute differences in

arsenal size do not provide robust evidence of a compellent advantage. The findings also survive a variety of robustness checks, alternative measurements of threat success, changes in the sample, additional controls, and efforts to address possible selection effects. The central empirical result is therefore not simply that explicit nuclear threats rarely occur, but that possession itself does not appear to cast the coercive shadow claimed by the nuclear-blackmail argument.

14.6 Limitations, Implications, and Conclusion

The authors emphasize what the study does not show. It does not claim that nuclear weapons have no political value, and it does not dispute their possible importance for deterrence. Deterring an attack on vital interests may involve different credibility conditions from compelling an adversary to give up something it already has. The study also cannot evaluate whether explicit nuclear compellent threats would work better, because leaders have almost never made clear, unambiguous threats to use nuclear weapons in support of compellent demands.

The analysis focuses on peacetime threats and therefore leaves open whether nuclear weapons might have greater compellent value once a war has already begun. Hiroshima and Nagasaki, as well as debates about the Korean War, illustrate why intrawar coercion may follow different dynamics. The authors present this as an important area for additional research rather than as a contradiction of their findings.

The theoretical implication is broader than nuclear politics: destructive capability is not the same thing as coercive leverage. Weapons that are exceptionally powerful in a military sense may be politically unusable when carrying out the threat would impose enormous costs on the coercer or fail to deliver the object being demanded. The practical implication concerns proliferation fears. Policymakers often warn that new nuclear states will be able to blackmail weaker neighbors. The historical record examined here provides little support for that fear. Nuclear proliferation may create many dangers, but enhanced success at compellent blackmail does not appear to be one of them.
